Successful protein structure prediction requires accurate low-resolution scoring functions so that protein main chain conformations that are close to the native can be identified. Two monoclonal antibodies highly specific for the blood ...  
The minor red cell membrane glycoprotein (glycophorin B) carries blood group Ss determinants [6,11] and is identical with N-glycoprotein in the first 25 amino acid residues of its NH<sub>2</sub>-terminal portion in individuals of all M and N blood groups [3, 6]. The structural complexity of M and N antigenic determinants gives rise to the formation of a variety of antibodies which may be directed [www.eel.net](#)  
The easy exchange between the two isomers manifest clearly on the Walsh diagram: no crossing between the orbital, no big different in energy of the frontier orbital, between that of reaction, TS and product structure.
